Executive Summary

Pure Earth discovered an former used lead acid battery (ULAB) recycling site in the Batiaghata union in Khulna Sadar Upazila. It has been designated as site BD-4938 in the toxic site identification program (TSIP) database (https://www.contaminatedsites.org). In November 2022, Pure Earth performed an initial site screening and preliminary site assessment (PSA) at the recycling site. According to the PSA report, the ULAB recycling site surrounding areas soils were contaminated. A detailed site assessment (DSA) was conducted by Khulna University (KU) in 2023. 132 soil samples and 11 water samples were collected and analyzed as part of the DSA in February 2023, and 23 of the soil samples revealed lead (Pb) concentrations >400 ppm with a highest result of 12,100 ppm. The aim of the Mohammadnagar clean-up project was to ensure the concentration of Pb in the impacted areas below 400 ppm so that the health of children and other residents in the Mohammadnagar area could be improved. The main elements of the Mohammadnagar clean-up project design included education/awareness campaign, capping of battery waste dumping sites, soil scraping and capping of contaminated soil and leaf matter, house cleaning, road and yard remediation.

The clean-up work began on April 1, 2023, and it was completed on June 15, 2023. The community and stakeholder engagement program was held on April 5, 2023 in the presence of community people, land owners of the contaminated site and other stakeholders. In total, 1350 m² of the impacted area was cleaned up during the remediation work. Size-wise the Northern dumping and Western dumping sites were 154 and 78 m², respectively. The dumping sites were located in waterlogged areas. After installing the bamboo, the North and West dumping sites and in between the depression areas were filled with sand to facilitate placing the geotextile and capping sand atop it. Then geotextile marker layers were placed in the dumping locations and then 2 ft clean soil was placed in the bamboo piling area. In total, 113 m³ of sand and 226 m³ of clean soil was required for capping the geotextile in the North and West dumping sites. The South battery waste dumping site was filled with sand. After measuring the South dumping site for placing the geotextile marker layer. About 1.8 m³ of the scraped contaminated soil generated from the roadway and yards was spread

atop the Southern dumping area prior to placing the geotextile and capping with excavated 1 feet sand and 1 feet clean soil (approximately 68 m³ of clean soil).

The surficial contaminated surface soils from adjacent impacted areas were scraped away. About 6-inch soil was scraped from the unpaved contaminated areas. Most of the impacted areas along the brick soling roadway revealed high Pb concentrations after the scraping work while unpaved impacted areas indicated Pb concentration <400 ppm. Accordingly, a cement and sand mixture layer was put in the brick soling road and house yard areas to prevent further Pb exposure. The concrete work was done covering an area of 157.94 m². The scraped contaminated soil was placed beneath the geotextile layer and the capping soil in the Southern dumping area.

Thirty old plastic battery cases found in the impacted areas were handed over to the Abdullah Battery Co. for recycling purposes. Five households were found to be contaminated with Pb dust. Household cleaning activity was done following the protocols specified in the project plan. After completing the clean-up work, a final XRF measurement was taken from the impacted areas. All the XRF measurements showed Pb concentrations below 400 ppm which indicates that the remediation work was successful.

The site-specific health and safety plan (HASP) was adhered to during the entire clean-up work to ensure the health and safety of the workers and associated personnel. On a daily basis, the records of First Aid, complaint/grievance, waste management, accident, incident, and near miss were kept in separate registers. Several grievances were addressed during the clean-up work. After completion of this work, clean-up work details were mapped and leaflets distributed throughout the community. One of the most important messages was for people not to disturb the capped area to avoid the spread of contamination from the dumping sites. This project showcases the practicality and viability of implementing cost-effective, scalable approaches to mitigate Pb contamination, thereby motivating stakeholders, policymakers, and communities to take action against this persistent global problem.

1. Project Background

The abandoned ULAB recycling site is located in the Mohammadnagar area, Babul Road, Zalma Union, Ward No. 6, Thana-Labanchora, Upazila Batiaghata, Khulna Bangladesh. The site is roughly 20 kilometers west of the Khulna city center, as depicted in **Figure 1**. The geographic coordinates of the site are 22.7887092 N and 89.5346505 E. According to residents of the area, ULAB recycling work started here in 2016. The owner of the house where the batteries were broken name is Mr. Badiuzzaman Mia (referred to herein as Mr. Badi), who operated the battery-breaking activities for about 3 years. Smelting of the lead plates was not conducted by Mr. Badi. By the end of 2018, the battery-recycling site was closed down or moved from this area under pressure from the people living nearby. Mr. Badi used to sell the battery casings to a nearby battery manufacturer and the old lead plates to smelters. Every day, about 6 people, including himself and members of his family, took part in the battery-breaking procedure without gloves or masks. Furthermore, no suitable safety and hygiene precautions were initiated prior to food and water intake at the ULAB recycling site. No information was found about Pb smelting here. However, due to the strong and persistent smell of battery acid, the community risked serious problems linked to respiratory inflammation.

The results of Pure Earth's investigations in November 2022 and Khulna University and Pure Earth in March 2023 are detailed in preliminary site assessment (PSA) report "Preliminary Site Assessment BD-4938 Badi Mia ULAB Recycling Works, Mohammadnagar, Khulna", dated 19 November 2022 and detailed site assessment (DSA) "Detailed Site Assessment BD-4938 Mr. Badi Mia's ULAB Recycling Works Mohammadnagar, Khulna", dated March 2023, respectively; the results are summarized herein for reference. **Figure 2** herein depicts the concentrations of 17 surface soil samples collected from the ULAB recycling site during the PSA investigation. Of the 17 samples, two exhibited a concentration exceeding 400 ppm. Notably, both high-concentration soil samples were obtained from the immediate vicinity of the source house. During the DSA, three battery waste dumping sites were identified near Mr. Badi's house. **Figure 3** illustrates the dumping sites, two of which are on the Northern and Western side of the house, referred to herein as the North dumping and West dumping sites. The dumping sites were waterlogged and connected with a body of water. The Northern dumping site was about 6 ft from the house and was approximately 32 ft long and 17 ft wide, while the Western dumping site was 1 ft from the house; this particular site was about 29 ft in length and 19 ft in width. Another battery waste dumping site was located at the southern side of the house, referred to herein as the South dumping. The distance to this dumping site was about 30 ft from the house. The battery waste dumping site was formerly a natural depression with a depth of about 3 ft during the recycling work. After dumping battery wastes there, the landowner of the area filled the dumping site with sand about 3 years ago. Soil samples were collected from the waste dumping site during DSA.

Figure 1: Mr. Badi's ULAB recycling site.

Figure 2: Lead concentration map showing the extent of XRF measurement (source: PSA report).

Figure 3: Identified dumping sites.

Out of 132 soil samples collected during the DSA, 23 revealed concentrations above 400 ppm. All the soil samples collected within 50 m radius of the recycling sites indicated a Pb concentration >400 ppm (**Figure 4**). Within a 50 m radius, the mean, median, minimum and maximum Pb concentrations in the surface soil were 510, 26,

8 and 12,100 ppm, respectively (**Table 1**). With the increase of depth, the Pb concentration diminished, yet there were some exceptions, as wastes were dumped below the current ground surface in several areas. The highest Pb concentration was found at a depth of 1.5 feet (**Figure 5**). The mean, median, minimum and maximum concentrations of the 1.5 ft depth samples were 4432, 74, 13, and 125,400 mg/kg, respectively (**Table 2**). At a 3 feet depth the mean, median, minimum and maximum concentrations of the soil samples were 138, 30, 15 and 1,136, respectively. A rough estimate of the impacted area due to the ULAB recycling work calculated that it was approximately 1,230 m² (**Figure 6**). However, after the community awareness program, the local community cooperated in the clean-up work and helped to confirm the correct size of the battery waste dumping sites. In fact, the size of impacted area increased from 1,230 m² to 1,350 m². In addition, XRF measurements were collected during the implementation of the risk reduction project to refine the areas that warranted capping as detailed in this report.

Figure 4: Lead concentrations in surface soil samples within 75 m radius (a) and its distribution (b).

Figure 5: Lead concentrations of dumping site at surface (a); 1.5 ft (b); and 3ft depth (c).

Table 1: Concentration of Pb in surface soil samples

Distance from source	Number of samples collected	Mean	Median	Minimum	Maximum	Number of samples with lead concentrations > 400 ppm
Surface soil sample	56	466	25	8	12100	10
Within 50 m	51	510	26	8	12100	10
> 50 m	5	17	15	12	27	0

Table 2: Concentration of Pb in different soil depth

Distance from source	Number of samples collected	Mean (ppm)	Median (ppm)	Minimum (ppm)	Maximum (ppm)
Subsurface soil samples (1 to 6 inches)	18	702	56.5	12	5,902
1 inch	4	475	137	17	1610
2 inch	4	69.2	36	15	190
3 inch	4	1,512	65	16	5,902
4 inch	3	773	26	13	2,280
5 inch	2	1042	1,043	12	2,070
6 inch	1	12	12	12	12
Subsurface soil samples (1.5 and 3 feet)	88	1818	38	10	125,400
Surface soil	30	774	34.5	10	12,100
1.5 feet	30	4,432	74	13	125,400
3 feet	28	138	30	15	1136

Figure 6: Impacted area of the Mohammadnagar ULAB breaking site (DSA report).

The DSA concluded that on-site capping of the battery waste dumping locations and scraping and capping of contaminated soil must be addressed in order to reduce the lead exposure risk to the surrounding population. The project in Mohammadnagar was subjected to an alternatives analysis by Pure Earth to identify and select the most appropriate and effective project activities, as detailed in Pure Earth's 2023 DSA report.

The factors that were analyzed as part of this analysis included:

- Risk reduction and public health benefit
- Sustainability
- Community and government acceptance
- Compliance with Bangladesh regulations and international standards
- Schedule how long to implement
- Technical or logistical challenges
- Cost

As detailed in the DSA, the selected risk mitigation strategy included capping of the battery waste dumping sites since there was an undefined amount of buried battery waste entrained in the contaminated soil in the three dumping areas. There were several concerns about excavating and managing (packaging, transportation, burial) of an unknown quantity of residual battery waste. These are extremely hazardous with respect to lead as well as acid content. Excavation of waste would require transportation and burial of waste in local solid waste landfill which may impact the health and safety of workers and residents. Conversely capping the battery waste in place had potential issues with erosion or future disturbance (e.g., sustainability), capping not addressing any potential groundwater or surface water issues etc. However considering the site condition, capping the waste in place was considered the most suitable option for risk mitigation. Capping was done by placing a geotextile and clean soil over the 3 waste dumping areas. Such areas are in low lying areas and the objective was to cap with on the order of 3 ft (1 m) of clean soil. The selected risk mitigation strategy included scraping and collection of lead impacted soil and leaf matter in adjacent areas (e.g., along the brick roadway). The selected risk mitigation strategy also included educational awareness workshops; yard remediation; and house cleaning to address lead dust in area homes. Pure Earth

representatives initially shared the plan with the Bangladesh Department of Environment in March 2023, and continued to involve DOE and other stakeholders in the risk mitigation project as detailed herein. Pure Earth presented the risk mitigation project plan to DoE in April 2023 seeking further DoE support for the project. Notably, DoE officials came to the project area every week during its implementation to observe our activity and give feedback.

2. Mohammadnagar Pb Risk Reduction Project Objectives and Schematic Diagram of The Remediation Work

The goal of this remediation work was to provide a comprehensive analysis and understanding of a Pb remediation project, aimed at addressing the pervasive issue of Pb contamination in the surrounding areas of the Mohammadnagar ULAB recycling site. Pb contamination poses dangerous health risks, particularly to vulnerable populations and children, and demands urgent attention. By addressing the objectives, we aimed to advance our understanding and implementation of Pb remediation efforts, fostering a safer and healthier future for the affected communities. **Figure 7** is a schematic diagram of the ULAB recycling site remediation work.

2.1 General objectives

- Improve the health of children and other residents of the Mohammadnagar area by reducing exposures to toxic Pb pollution generated by the former ULAB recycling operations.
- Increase the number of Pb remediation projects in Bangladesh by further demonstrating their feasibility, affordability and effectiveness.
- Diminish future risks from Pb pollution in Mohammadnagar and other towns by illustrating the dangers of conducting informal ULAB recycling in residential neighborhoods.

2.2 Specific objectives

- Increase local and national awareness about the dangers of Pb and simple methods residents can take to protect themselves and their family members.
- Reduce the concentration of Pb in surficial soil to below 400 ppm (the EPA standard for residential areas where children play).
- Increase the capacity of Pure Earth's project partners at the Khulna University, Department of Environment (DoE), and other stakeholders to carry out such work in the future.

Figure 7: Schematic diagram of the ULAB recycling site remediation work.

3. Risk Mitigation Project Implementation

The elements of the risk mitigation project were detailed in the Pure Earth report "Lead Risk-Mitigation Project Plan, BD-4938 Mr. Badi's ULAB Recycling Works Mohammadnagar, Khulna, Bangladesh", dated April 20, 2023. The elements of the risk mitigation project were carried out during May 01, 2023 to June 15, 2023.

Each of the main elements of the risk-reduction project are presented below:

- Community and stakeholder engagement program
- Worker, Equipment, and Health and Safety Consideration
- Budget and Accounting
- Evaluation of Lead concentrations in vegetation samples
- Mohammadnagar ULAB recycling site remediation activities
- House and yard cleaning work
- Outside fencing and tree plantation on the dumping sites
- Waste management, collection and handover of residual battery cases,
- Final XRF measurement of the impacted areas
- Distribution of leaflets of project activities
- Grievance Redress Mechanism (GRM)
- Communication with Pure Earth technical advisor and Pure Earth Bangladesh team

3.1 Community and stakeholder engagement program

3.1.1 Stakeholder engagement program

An awareness program was arranged for the community and stakeholders near the clean-up site. The program was conducted in the Local Member's (elected representative of Mohammadnagar area) office on 5th April 2023. The office was within 100 m of the ULAB recycling site. Various community people and stakeholders were considered for the awareness program (see Appendix B), where people from all sectors of society were invited including community people who lived within 100 m of the site (68 households), land owners of the contaminated site, politicians, local government representatives, academicians, students, experts, representative of DoE, representative of Directorate General of Health Services (DGHS), representatives of NGOs, youth groups and relevant international organizations. A total of 113 people were invited to the program. Door-to-door visit was considered as the best way to distribute the leaflet and invitation letter to people in the community. Relevant

government officials, different organizations and other stakeholders were invited via email, physically and mobile phone communication (Figure 8).

Figure 8: Distribution of leaflets and invitation letter for the community and stakeholders' engagement program.

The team leader of the remediation project first briefly gave an overview of the entire project and discussed the remediation work planned to minimize the Pb exposure to the community for present and future generations. He also requested the community and stakeholders cooperate and provide suggestions for successful completion of the remediation work. The other special guests from DoE, DGHS, Civil Surgeon Office Khulna and Country Director of Pure Earth discussed the health risks posed by Pb and how children's health could be protected from Pb pollution (**Figure 9**). The speakers also discussed the importance of remediation work. The Chair of the community and stakeholders engagement program thanked all participants and concluded the discussion session. There was an open discussion session in which members of the community asked questions, and experts and special guests answered them. After this session, the guests and community people and stakeholders swore an oath to be conscious about Pb pollution. Awareness program

activities were also published on several online news portals and in newspapers (Figure 10).

Figure 9: Community and stakeholders engagement program photos.

Hundreds of people took oath in an awareness session in Khulna to prevent lead pollution

"Together, we can solve lead pollution" with this slogan hundreds of community people, local leaders, government and non-government representatives, police, and media reporters united in a community and stakeholder

Figure 10: Media coverage of the community awareness program held in Khulna on 5th April 2023.

3.1.2 Discussion with landowners of the impacted area

After the community engagement program, we discussed the issue with landowners who have land in the impacted area (**Figure 11**). Some landowners did not attend the community engagement program. We discussed with all landowners physically or by phone and got their consent to clean-up the affected areas. Before the community engagement program, we encountered difficulties in getting some landowners to cooperate. However, after the program commenced all cooperated in the clean-up work and provided their suggestions. Particularly, the cooperation given by Mr. Badi was vital to continue this part of the project. After the community engagement program, he helped us to identify the North and West battery waste dumping sites. We did find it difficult to identify the dumping site since Mr. Badi did not cooperate before the program began. The dumping sites were in waterlogged areas, so it was not possible for us to initially identify or measure the dumping sites. He did show us the Southern dumping site where most of the residual battery wastes was located.

Figure 11: Mr. Badi (left photo) and landowner (right photo) helped to delineate the battery waste dumping areas.

3.2 Worker, Equipment, and Health and safety considerations

3.2.1 Workers and equipment

For the remediation activities Khulna University engaged skilled local workers, increasing local capability for such work. Workers were hired based on the requirements of the clean-up work. Workers were informed of the type of work that they were going to be doing and the risks associated with working with lead contaminated wastes and soil, as well as working around heavy equipment during the

project. The workers were informed of the necessity of wearing personal protective equipment such as boots, N95 respirators, hard hats, etc.) which were provided.

Khulna University hired more than 20 workers for the risk mitigation project, along with one labor supervisor. The number of workers hired was determined based on the activities of a particular day. A list of workers and supervisors for a representative day is included in Appendix D. The local workers were supervised on a daily basis by Gazi Mohammad Faruk Hossain. The number of workers, the work completed, compliance with the health and safety requirements, and any problems that were encountered were recorded on a "Daily Work Sheet" for documentation; the Daily Work Sheets are included in **Appendix A**.

All the work was completed with hand tools and manual labor, including packaging wastes, clearing brush, manual excavating the soil through spade, scraping soil over brick soling area, and house cleaning/yard remediation as detailed below. The workers were supplied with a variety of hand tools such as shovels, spade, wheelbarrows, and hoes. A representative equipment list is included in **Appendix A** for reference. Laborers and supervisors were provided drinking water, food, laundry and showering/washing facilities on a daily basis over the roughly 2.5-month project (April 1, 2023 to June 15, 2023). Work was generally completed during a six-day work week except on government holidays, with working hours from 8 am to 4 pm.

3.2.2 Health and safety plan

A site-specific Health and Safety Plan (HASP) was specified in Appendix A of the Pure Earth report "Lead Risk-Mitigation Project Plan, BD-4938 Mr. Badi's ULAB Recycling Works Mohammadnagar, Khulna, Bangladesh, dated April 20, 2023" The HASP was implemented by the Khulna University, with Rashedul Islam who served as the Occupational Safety Assistant that was responsible for assuring that the HASP was implemented accordingly. Many of the HASP elements (e.g., that workers wore appropriate PPE, workers washed before lunch and at the conclusion of the work day; workers' clothes were washed) were recorded each day on a "Daily Work Sheet" (see Appendix A herein). Workers not following the HASP and PPE requirements was cause for dismissal. Visitors to the site, such as DoE personnel and a videographer group were informed of the HASP requirements, and were also recorded on the Daily Work Sheets. The local population was prohibited from the work area to the maximum extent practicable. Barricade with proper signage was maintained during site activity.

Daily pre-work toolbox talk session was given to them during daily work hours. During tool box talk information was provided on waste management, washing hands with soap before eating food, drinking water to cure dehydration, proper handling procedure of heavy and sharp tools. All the site activities including outer bamboo piling, manual excavation activities, scraping of contaminated soil, handling old battery cases, clean sand and soil placing in the dumping sites were completed in accordance with the site-specific health and safety plan (HASP) as part of the project plan. PPEs such as safety shoes, long pants and long sleeves, hard and soft hats, and rubber gloves worn properly during the site activities were provided (**Figure 12**). After completion of the each day's work, suits were washed with detergent and then dried in dryers. Boots, gloves and glasses were washed by workers themselves after daily site activities.

Figure 12: Photos showing health and safety considered during the cleanup work.

Two fire extinguishers were available at the work site. In addition, proper signage and barricades were put in place, workers were provided with drinking water, First Aid facility and rest places made available, etc. All the records were documented in the register book (**see Appendix C**).

3.2.3 DoE participation

The DoE actively participated and provided necessary support for the clean-up work. The department monitored the DSA work regularly. DoE representatives visited the site and monitored the clean-up work progress. DoE Director, Khulna, visited the remediation site during the community engagement program, clean-up work, and tree plantation phase (**Figure 13**).

Figure 13: DoE Director visited the site

3.3 Project budget and accounting

Table 3 tabulates the total budget required for the Mohammadnagar Clean-up project. The total expense amounted to US\$13,295 (1382,570 BDT). The conversion rate was 1 USD = 104 BDT. After successful completion of the awareness program, two categories of clean-up items were purchased. The first one was the equipment or tools needed for scraping and clean-up work, while the other concerned the safety items used for the protection of workers and the surrounding community people during the remediation work. Most of the items were purchased from a Khulna safety equipment suppliers' shop. Some items were sourced from Dhaka including geotextile and a HEPA vacuum cleaner. Table 3: Budget accounting.

Purpose	April (BDT)	May (BDT)	June (BDT)	Total BDT	Total USD

3.4 Evaluation of Lead concentrations in vegetation samples

To assess Pb concentration in area vegetation samples, samples of vegetation were collected from within 50 m of the ULAB recycling site (Figure 14). The subsequent analysis results are summarized in **Table 4**. All the vegetation samples showed high Pb concentration. The root of *Elephant Grass* had the highest Pb concentration at 384.88 mg/kg. FAO/WHO acceptable Pb concentration in vegetation samples is 0.5 mg/kg. To get an idea about the sources of Pb in these samples, we collected soil samples from the vegetation sampling points (Figure 15). Vegetation and soil samples were collected from the control site for comparison. Table 4 also shows Pb concentrations of the control site vegetation samples. Elephant grass had the highest Pb concentration of 5.34 mg/kg. In the control site vegetation samples, root samples had low Pb concentrations compared to the samples collected from the ULAB recycling site. High Pb concentrations in the root samples from the contaminated site may be due to the adsorption of Pb from contaminated water. Bottle Gourd and Malabar Spinach were the consumable vegetation in the site. Consumable vegetation available in the contaminated site was removed, as detailed below. Here it is necessary to state that Pb was not detected in the water samples collected during DSA from the vegetation sampling and control sites. For laboratory results, see Appendix E.

3.5 Mohammadnagar ULAB recycling site remediation activities

3.5.1 Commencement of the clean-up work

The start of the clean-up work was designated for April 16, 2023. On this day, all the household waste and construction waste materials were collected from the western side of Mr. Badi's house (**Figure 13**). The stockpiling of the household and construction waste was covered with tarpaulin and dumped in the Rajbandh KCC dumping site. The program witnessed a great deal of stakeholder engagement. The DoE Director visited the site and gave his suggestions. We also discussed with landowners whose land was to be impacted by the clean-up work. The first day of field activity and community/ stakeholders visiting the site are presented in **Figure 16 and Figure 17**, respectively.

Figure 16: Household and other construction waste cleaning from the site.

Figure 17: DoE Director, landowners and Pure Earth team visited the site during the kick off day.

3.5.2 Capping work in the North and West dumping sites

Dyke construction

The North and West dumping sites were in waterlogged areas. Preparation of an earthen dyke was required to dewater the area before start of the clean-up work. An earthen dyke was built around the dumping sites and the water was pumped out in the adjacent water body (**Figure 18**). All workers were well equipped with PPE as specified in the Health and Safety Plan, and no ULAB recycling waste was collected or removed from the site during this process.

Figure 18: Earthen dyke in the West and North dumping sites

Delineation of the dumping sites

Additional delineation of the dumping sites was completed after the dewatering work. Battery waste became visible in the dumping sites after the dewatering work. The boundary of the dumping areas was confirmed by analyzing Pb concentrations of the soil at ground surface and at depth. Soil samples from surface and 1 ft depth were collected from both inside and outside of the planned bamboo piling demarcation areas to confirm that the Pb concentrations are below the recommended level. Bamboo piling was placed about 3 to 5 ft away from the waste dumping end point. **Figure 19** shows soil Pb concentrations in the North side dumping site. All the surface samples analyzed from the inside and outside of the bamboo piling areas showed Pb concentration below 400 ppm except one sample. However, when the samples were collected from 1 ft depth, no sample inside the bamboo piling showed a Pb

concentration above the recommended level (400 ppm). None of the samples from outside of the piling area indicated a Pb concentration above the recommended level.

Figure 19: Pb concentrations of surface and 1 ft depth soil samples from inside and outside of the bamboo piling area of the North dumping site

In the West dumping site, one sample from outside of the bamboo piling area showed a Pb concentration above 400 ppm. The reason for the high Pb concentration of the sampling point may be battery recycling waste deposit. Due to tubewell and other structures near the point, it was not possible to include the area inside the bamboo piling. We scraped contaminated soil from the point and ensured soil Pb concentration in the area was below 400 ppm. Several samples collected from inside of the piling area showed a Pb concentration above 400 ppm (**Figure 19 & Figure 20**).

Figure 20: Pb concentrations of surface and 1 ft depth soil samples from inside and outside of the bamboo piling area of the West dumping site.

Bamboo piling work

After delineation of the dumping sites and measurement of soil Pb concentrations inside and outside of the planned bamboo fenced areas, the bamboo piling with netting started at the North and West dumping sites (**Figure 21**). Bamboo piling was considered before the capping work to prevent soil erosion from the capped area since the dumping site surrounding area was waterlogged. Heavy rainfall during the rainy season may erode the capping layers (sand and clean soil layers). There were some areas between the dumping sites where battery waste dumping was not evident and lead concentrations in soil were less than 400 ppm. Nonetheless, these area were capped for logistical reasons, e.g., to connect the North and West dumping areas.

Figure 21: Bamboo pilling work in the North and West side of Mr. Badi's house.

Sand filling in the dumping sites

The North and West dumping sites are contiguous and border two sides of Mr. Badi's residence. After installing the bamboo, the North and West dumping sites were filled with sand to facilitate placing the geotextile and sand atop it. (**Figure 22 & Figure 23**). A total of 113 m³ of sand was required for initial capping of the North and West dumping sites.

Figure 22: Sand filling of the North and West dumping sites.

Figure 23: North and West side dumping sites after 1 ft sand filling

Placing geotextile layer and clean soil

Before sand filling in the North and West dumping sites and the depression areas between these sites, the dumping locations were barricaded so that the geotextile layer could be placed properly over these areas once sand filling had stopped. A geotextile layer was placed a top of the sand-filled areas as a marker layer (**Figure 24**).

Figure 24: Placing geotextile layer in the North and west dumping sites.

Clean soil was purchased and XRF measurement was completed before and after the clean soil was placed in the dumping areas (**Figure 25**). The XRF measurement data of the clean soils are shown in **Table 5**. The maximum Pb concentration in the clean soil was found to be 33 ppm. The bamboo fenced areas of the North and West dumping sites was filled with 2 ft clean soil atop the geotextile and the one ft. of clean soil beneath it. In total, 226 m³ of clean soil was required for capping the geotextile in the North and West dumping sites. A 1:1 slope in the capping soil was maintained adjacent to the bamboo fence to ensure that the bamboo fenced areas would remain intact. Note that the sloped areas are interior to the bamboo fence but outside the area that warranted capping, i.e., the full two ft. of soil atop the geotextile covers the actual dumping site with lead concentrations >400 ppm. (**Figure 26**).

 Table 5: XRF measurements of the clean soil.

Figure 25: XRF measurement of the clean

Figure 26: Placing clean soil and 1:1 slope work at North and West dumping site.

Bamboo piling outside of the dumping sites

To protect soil erosion at the inside of the bamboo piling areas another bamboo piling was installed about 2 ft far from the previous bamboo piling areas. Most of the areas between the two bamboo pilings constituted natural depressions. So first the depressed areas were filled with clean soil. Then 1.5 ft clean soil was placed to ensure a 1:1 slope between the top of the capped area and the surrounding areas. (**Figure 27**).

Figure 27: Bamboo pilling with 1:1 slope and placing grass at North and West dumping site.

Putting grass in the dumping sites

Grasses were brought from non-contaminated areas and placed above the 2 ft clean soil and 1:1 slope area (**Figure 28**). Grass cover was chosen because it will prevent soil erosion during heavy rainfall in the rainy season and hold the clean soil in place. The dumping sites before and after remediation work are shown in **Figure 28**.

3.5.3 Remediation of contaminated road, yard and other impacted areas

Soil scraping from the contaminated road, yard and impacted areas

During the DSA of the Mohammadnagar ULAB site, high Pb concentration was found in the surface soil of the surroundings of Mr. Badi Mia's house and nearby brick soling road and yard areas. The contaminated soil was first scraped from the affected areas. Proper signage and barricades were ensured for keeping people clear of the scraping area since there was a high chance of Pb exposure from contaminated soil and dust. Frequent water spraying was considered to control the dust. Safety jacket, N 95 Mask, goggle, and other required PPE was ensured for workers who were engaged in the scraping work. Frequent XRF measurements were taken during the scraping work to ensure that all contaminated soils were removed. About 6 inch soil was scraped from the unpaved contaminated areas. Except for the dumping sites, the majority of the impacted areas (Figure 29) were brick soling such as the road adjacent to Mr. Badi's house and house yards. From the brick soling areas, soil from the bricks surface and spaces between the bricks was scraped (Figure 30). An area of approximately 158 m² was chosen for the soil scraping work. The scraped contaminated soil was stored in plastic bags and covered with a tarpaulin; this contaminated soil was later spread atop the Southern dumping area prior to placing the geotextile and capping with clean soil, as detailed below. After scraping the soil, the entire brick soling road and yard areas were washed with clean water and an XRF measurement was taken. Most of the brick soling areas betrayed high Pb concentrations after the scraping work (Figure 31) while other unpaved impacted areas were found to be contamination-free (Figure **32**). In the brick soling road and house yard areas the highest lead concentration was 11,500 ppm. In general, it was not possible to remove dust or mud completely from the uneven surface of the brick work. As well, mud from spaces between the bricks could be washed out during rainy season. So, covering the brick soling areas with concrete proved to be a feasible solution to protect from further Pb exposure.

Figure 29: Impacted area.

Figure 31: Pb concentrations in the brick soling road and house yard areas after soil scraping.

Figure 32: XRF measurement from unpaved contaminated areas.

Brick soling road and yard concrete work

Cement and sand mixture layer was placed in the brick soling road and house yard areas. The concrete work was covered an area of 158 m² (**Figure 33**). After the concrete work, 11 XRF measurements were taken from the road and 16 XRF measurements were taken of the house yard areas. None of the measurements showed a Pb concentration > 400 ppm (**Figure 34**).

Figure 33: Road and house yard brick soling area before (left) and after (right) concrete work.

Figure 34: Map showing lead concentration of yard, road areas after concrete work

3.5.4 Capping work at the South dumping site

Delineation of the dumping site

The South dumping site and surrounding areas were low land in 2016 when the battery recycling was in operation. After the dumping occurred, the landowners filled the whole area with sand about 3 years ago. The location and extent of the dumping area was unclear at the start of the project due to the addition of up to 3 ft. of sand atop this area. In addition, the South dumping site was even with surrounding grade level, making capping somewhat challenging.

The approximate center point of the South dumping site was identified by consultation with the community's people. From the center point, borings using an auger was considered for different directions of the dumping site, and soil/battery waste samples were collected for XRF reading to confirm dumping area and filled sand depth. Except for the border areas of the dumping site, depth refers to the sand layer's depth above the dumped waste. Soil/battery waste samples were collected where the sand layer ends and soil and battery waste layer starts. **Figure 35** displays the Pb concentration of different depth soil/battery waste samples. During the DSA of the site, no contamination was detected in the sand layer. In the border of the dumping area, we looked at 3 ft depth soil samples for XRF measurement to confirm where the dumping area ended. The point showed that 21000 ppm Pb concentration was considered as the center point during delineation of the dumping area. The XRF readings are available in **Appendix F.**

Figure 35: Delineation of the South battery waste dumping site.

Excavation of sand from the South dumping site

After delineation of the South dumping site, it was confirmed that no battery wastes or soil with lead concentrations >400 ppm was evident within a depth of 1 ft. So, excavation of the upper 1 ft. of the sand layer was considered to facilitate placing the geotextile marker layer and additional soil while not adversely affecting area grading (**Figure 36**). An area of nearly 136 m² atop the dumping site was manually excavated. First, the top 6 inches of sand were excavated. Frequent XRF measurements were taken during excavation work to ensure Pb concentration of the scraped sand was below 400 ppm and dumped battery waste were not exposed (**Figure 37**). Only one measurement showed a lead concentration higher than 400 ppm (**Figure 38**). Scraping of 2 inches of contaminated sand from the location and surrounding 3 ft area was considered. After scraping, the Pb concentration of the dumping area was done. During this 1 ft excavation, XRF measurements were taken and found all the excavated area Pb concentration below 400 ppm (**Figure 39**). The excavated sand stockpile was covered with tarpaulin after the day's work ended (**Figure 40**).

Figure 36: Excavation of top 1 ft soil of the south dumping site.

Figure 37: XRF measurements taken during excavation work of the south dumping site.

Figure 38: XRF measurements after 6 inch excavation of the dumping site.

Figure 39: XRF measurements after 1 ft excavation of the dumping site.

Figure 40: Tarpaulin was used for covering the excavated clean sand stockpile of the south dumping site.

Placing contaminated scraped soil on the top of the excavated area

The scraped contaminated soil from brick soling yard and road, and from other leadcontaminated area was placed atop the Southern dumping area where 1 ft of clean soil had been excavated (**Figure 41**). The spread soil was about 0.5 inches thick.

Figure 41: Placing scrapped contaminated soil and geotextile marker layer in the South dumping site.

Placing the geotextile layer and excavated sand

After placing scraped contaminated soil on top of the 1 ft excavated area, a geotextile layer was placed over the dumping areas (Figure 41). Then the total area was filled with the previously excavated clean sand, and the sand layer was leveled and compacted by spraying water and hammering.

Placing clean soil and grass on the site

After compaction of the sand layer, 1 feet clean soil was placed above the sand-filled dumping areas. So there was 2 feet capping above the geotextile layer, 1 feet with excavated sand another 1 feet with clean soil. The clean soil layer was hammered and leveled. 1:1 slope was considered beyond the edges of the dumping areas (Figure 42). To prevent soil erosion the whole dumping area including the 1:1 slope area was covered with grass. The south dumping site before and after the remediation work is depicted in Figure 43.

Figure 42: Filing south dumping site with 1 ft excavated sand and 1ft clean soil.

Figure 43: South dumping site before (left) and after (right) remediation work.

3.6 House and yard cleaning work

During remediation activity XRF measurements of the household dust, courtyard soil and household soft materials (mattress, pillow and sofa) were taken from households located within 50 m of Mr. Badi's house. Both impacted areas and the surrounding households were accounted for the house and yard cleaning activity. The XRF measurements were done to select the houses that required cleaning work (Figure 44). Courtyards soil samples from different direction of the households were considered during XRF measurements. A Ziploc bag was provided to every individual household to collect the dust. They were requested to collect dust after sweeping the floors and mattresses and stored in the Ziploc bag. The dust samples were then labeled with GPS coordinates and an identifying code, and XRF measurements were taken. For household soft materials, XRF measurements were taken from the mattresses, pillows of the bed room and cushions of sofa.

Figure 44: Pb concentration; in the courtyard soil samples (a); in household soft materials (b) and in household dust (c)

Out of 25 XRF measurements taken from the courtyard soil samples, 5 samples revealed high Pb concentrations. All those samples were collected from Mr. Badi's courtyard. The rest of the courtyard soil samples were Pb contamination-free (**Table 6**). As previously mentioned, Pb contaminated soil removal from brick soling road and yard was not possible due to uneven surface of the brick and mud from spaces between the bricks could be washed out during rainy season. So, we considered covering the brick soling areas with concrete to mitigate the Pb exposure. Some households' dust samples showed high Pb concentrations (**Figure 44**). XRF measurements of the household soft materials revealed four households' soft materials had Pb concentrations higher than 400 ppm (**Table 6**).

After identification of 5 affected houses, we cleaned the households following the protocols specified in the project plan "Lead Risk-Mitigation Project Plan, BD-4938 Mr. Badi's ULAB Recycling Works Mohammadnagar, Khulna, Bangladesh, dated April 20, 2023". A three-step cleaning procedure was used:

1) Removing all materials and vacuuming the area with a HEPA vacuum (HEPA: High Efficiency Particulate Air filter. HEPA filters can remove fine dust particulates greater than 0.3 microns in diameter with 99.97% efficiency).

2) Wet washing and scrubbing with a detergent solution to dislodge lead dust, followed by a clean water rinse and wet vacuuming to removal all water. About 0.2 m³ of water used for washing and cleaning purposes was disposed into the Pb contaminated underground tank (containing 8.1 m³ of Pb contaminated water) located in the Labanchora Pb smelter site Khulna. The detailed of the underground tank and wastewater Pb concentrations are available in the draft DSA report of the Labanchora Pb smelter site "Detailed Site Assessment, BD-4834 Lead Smelting Works Kuwait Mosque Area, Labanchora, Khulna, Dated March 05, 2023". Pure Earth has plan to remediate the Labanchora site including the underground tank Pb contaminated water after the end of rainy season of 2023.

3) A final HEPA vacuuming after all surfaces have dried. Furniture and other personal items were moved back into the rooms after the items and room had been cleaned. All hallways and central areas were then cleaned thoroughly following the same three-step process.

Details of the households and house cleaning work are discussed below:

Houses 1, 2 and 3 had Pb concentration > 400 ppm in dust samples. Houses 2 and 3 had soft materials with high Pb concentrations ranging from 490–761 ppm. These three houses were made of corrugated iron sheets. The houses' floors were brick soling. We wet mopped the houses with a detergent solution including the tin surface from the outside and inside. After drying the houses were vacuumed with a HEPA vacuum cleaner including soft materials and furniture.

House 4 was Mr. Badi Mia's house. The house was the source of the ULAB recycling activities. High Pb concentration was found in the household dust samples (2565 ppm) and in soft materials like pillows and mattresses. This house was fully concrete-built.

At first all the furniture was removed and thoroughly dry cleaned with a HEPA vacuum cleaner. All the rooms were then dry cleaned with a HEPA vacuum cleaner including the floor, walls, and ceilings. Detergent water was sprayed and the area scrubbed prior to washing with clean water (**Figure 45**). After wet cleaning, a final HEPA vacuuming was done to remove any leftover dusts. The soft materials including mattresses and pillows were thoroughly vacuumed as per the protocol stated in the project plan (**Figure 46**).

House 5 was located about 40 m far from the source house. It was on the North side. Only one XRF reading was found and it was >400 ppm in the mattresses. When the ULAB recycling activity was in operation the household members lived within 10 meters of Mr. Badi's house. Some of the household members also worked in Mr. Badi's ULAB recycling operation. Later they moved to the present location. This house was semi-pacca. Wet and dry cleaning was done for it similar to house 4.

Figure 45: Photos showing house cleaning work (wet Cleaning).

Figure 46: Photos showing house cleaning work (Dry cleaning).

After completing the house- cleaning activities, XRF measurements of dust and soft materials were taken again to confirm that houses were cleaned and all the XRF readings were below 400 ppm (**Figure 47**).

Figure 47: Map showing Pb concentration of household dust sample and household soft materials samples after household cleaning activities.

3.7 Outside fencing and tree plantation on the dumping sites

Shallow rooted 3 flower plants and 3 fruit plants were planted in the capped areas. The main reason of planting shallow rooted plants was to ensure that plants roots will not penetrate the geotextile layers. Tree plantation was chosen because it can protect against soil erosion and retain the long-term sustainability of the capped areas. In addition, bamboo fence and netting were put in place to safeguard the trees from animals (**Figure 48** and **Figure 49**).

Figure 48: The West (left) and the North (right) dumping sites after fencing and tree plantation work.

Figure 49: The South dumping sites after fencing and tree plantation work.

3.8 Waste management

Contaminated scraped soil

All the scraped contaminated soil (e.g., from the brick roadway) was stored in plastic bags and covered using a tarpaulin. The scraped contaminated soil was then dumped into the South dumping site before putting the geotextile layer in place.

Old plastic battery cases

From the dumping sites and house yard areas 30 old plastic battery cases were found. The battery cases were stored and covered with a tarpaulin. The battery cases were handed over to Abdullah Battery Co. for recycling (**Figure 50**). All the waste management records are available in the waste management register (**see Appendix D**).

Figure 50: Handed over of the plastic battery cases to Abdullah Battery Co.

Household waste

Household wastes, both biodegradable and non-biodegradable (cloths, polythene sheet, pet bottles, kitchen waste, wood, bricks) available near the West dumping site were cleaned. The waste collected from the site was disposed of at the KCC waste dumping site.

3.9 Final XRF measurement of the impacted areas

The total impacted area of Mohammadnagar ULAB recycling site was calculated and it was roughly 1350 m². A total of 109 XRF measurements were taken from the impacted areas. From the contaminated courtyard, roads and other unpaved surface areas, 39 XRF readings were taken and all measurements were found to be <400 ppm. The average Pb concentration was 59 ppm compared to the average Pb concentration of 466 ppm prior to the clean-up work. The maximum concentration was 186 ppm. At the impacted houses, 18 XRF measurements (dusts and soft materials like pillow and mattresses) were taken. The mean Pb concentration was 67 ppm with a maximum reading of 234 ppm. From the North and West dumping sites, 34 XRF readings of the clean soil were taken. The average and maximum Pb concentrations were 22 and 48 ppm, respectively. Eighteen XRF measurements were, respectively, 18 and 26 ppm. Details of the XRF measurements are presented in **Table 7**.

ULAB impacted sites	Area (m²)	Number of XRF readings	Mean	Median	Minimum	Maximum
Contaminated yards, roads and other impacted areas	780	39	59	46	15	186
Impacted houses	120	18	67	29	0	234
North and West dumping site and surroundings	300	34	22	22	15	48
South dumping site and surroundings	150	18	17	16	11	26

Table 7: Final XRF	measurements of the	remediation site

3.10. Distribution of leaflets of project activities

Once the clean-up work was completed, activities and capped area detailed information including location map was prepared and distributed to all people in the community. Details of capping work were shared with them and especially making the point that they should not disturb the capped area (**Figure 51**). The leaflet included recent pictures of dumping sites and graphical representation of layers beneath the dumping sites after remediation work (**Figure 52**). Through the leaflet, we requested them not to disturb the dumping area as this will reduce any likelihood of lead exposure in future. We talked with the local people and made them aware about the importance of leaving the capped areas alone.

Figure 51: Leaflet distribution among the community people.

Figure 52: Leaflet showing impacted area map, cleanup work details and key messages in local language.

3.11. Grievance Redress Mechanism (GRM)

Seven grievances were recorded during the clean-up work (see **Appendix C**). One neighbor complained that local people were not employed to help with this work. To solve the issue local interested workers were recruited. One worker complained that due to the high humidity he found it difficult to work wearing PPE. Frequent breaks were provided to all workers to solve the issue as best as possible. There were some grievances directly related to the clean-up activities. During dyke work in the North dumping site, Mr. Badi complained that we were excavating soil from road areas and putting it in the dyke work. We stopped using soil from the roadside and collected soil from elsewhere. Mr. Badi's wife commented on solving the waterlogging issue that occurred on the South side of the West dumping site. Natural drainage was hampered due to the capping work, and the courtyard area was under threat from waterlogging (Figure 53). Natural drainage was put in place to solve the issue. Md. Ismail Hossain, one of the landowners of the West dumping site, complained that he was not informed about the clean-up work and several other landowners of the area had the same experience. The project leader talked with him over the phone, and he was happy after understanding the importance of the work. Md. Liakat, the owner of the South dumping site, complained that several portions of his land were damaged due to transportation of the heavy vehicles for clean soil transportation. He wanted the damaged areas to be repaired and this was subsequently done (Figure 54).

Figure 53: Waterlogging issue due to the capping work in the South site of the West dumping site.

Figure 54: Unpaved area damaged due to the heavy vehicle transportation was repaired.

3.12 Communication with Pure Earth technical advisor and Pure Earth Bangladesh team

Regular communication was maintained with the Pure Earth Bangladesh team. Several meetings were conducted with the technical advisor, Gordon K. Binkhorst of Pure Earth in New York. Comments and suggestions of the Pure Earth team members were taken into account during the clean-up work. Progress of the clean-up work was also shared weekly via email.

4. Conclusions

About 1350 m² of the impacted area surrounding the ULAB recycling site was capped with a geotextile and clean soil during the clean-up work. The risk-mitigation strategy for the Mohammadnagar recycling site included the following major project elements, which were completed within 2.5 months from 1 April 2023 through to 15 June 2022:

Awareness program: A community and stakeholder engagement program about the risks of Pb in general and the risk-mitigation project was held before the clean-up work commenced. The program explained the purpose of community participation and stakeholder engagement in the clean-up work.

Road and yard remediation: Scraping of 1.8 m³ of contaminated soil from the impacted area was then buried at a depth of 1 ft at the South dumping site before a geotextile market layer was put in place. Brick soling yard and road covering an approximate area of 158 m² was concreted to stop or minimize exposure to lead.

Capping work: About 436 m² (300 m² in the North and West dumping sites and 136 m² in the South dumping site) area was capped with sand and clean soil. Before the clean soil was delivered to the site, sand and a geotextile marker layer was put in place. The area was then subjected to extensive fencing and tree plantation to prevent soil erosion.

Old battery cases: 30 battery cases were collected and handed over to Abdullah Battery Co. for recycling.

House cleaning: Five households were found to be contaminated. Households were cleaned according to the protocol stated in the project plan.

Long Term Monitoring and Maintenance Plan

Since this is a risk mitigation project, and while capping is not a permanent solution it does mitigate exposure with an appropriate long term monitoring program to make sure the cap remains in place. There is possibility of further exposure from capped area and brick soling road and yard paved areas. So we considered a 5 years monitoring plan for the remediation site. The monitoring plan includes annual inspection, repair of capping material, no excavation in area of caps; restricted site

usage; XRF at ground surface; inspection of paved area on roadway and yard; reporting; photos etc.
